4.When the user clicks "Fill Survey" button on lead record page, Ask the user 5 questions, one question per screen, On the final Page after clicking Finish button, Update the field "Survey Completed" on the lead object to True (it's a checkbox).

- First, we have to create a custom object called "Survey Response", which is used to store the response of the survey.
- Then in that object we have created some filed to store data, in that we have created Lookup relationship with lead so that we can relate the survey to lead.
- And the main point is that if the Survey Completed is checked, we didn't allow user to fill survey again. And we provide pause option to the user.
